

easyPush Server Environment

easyPush is based on two main elements: the iPad application and the easyPush middle ware. The iPad application itself can be seen as "Framework", which includes the structure and the core logic for the out-of-the-box functionalities. The content on the other hand is managed via the easyPush middle ware. All content changes, the upload of documents, navigation-structure, segmentation and permissions is done by using a web front-end for the easyPush middle ware. In order of streamlining your existing environment and processes with regards to content- or user-management, the easyPush back-end allows to integrate legacy systems (e.g. SAP, Salesforce, SharePoint, etc.) by exchanging data via Web Services (SOAP, XML).
